The CC human mpGES-1 gene is located on chromosome 9, more specifically to 934.3. The present invention also describes: (1) antisense compounds, CC having a sequence comprising 8-30 by targeted to a nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and CC inhibits its expression; (2) a method of inhibiting the expression of CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC having a disease or condition associated with mpGES-1. MpGES-1 chimeric CC antisense oligonuclectides and antisense compounds have cytostatic, CC antidiabetic, immunomodulator, cardiant, neuroprotective, cophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or Ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁

The present sequence represents a chimeric antisense oligonucleotide C targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human microsomal prostaglandin E2 synthase (mpGES-1). The chiman mpGES-1 gene is located on chromosome 9, more specifically to CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC mpGES-1 in cells or tissues; and (3) a method of inhibiting the expression of CC maving a disease or condition associated with mpGES-1. MpGES-1 chimeric CC antisense oligonucleotides and antisense compounds have cytostatic, cantisense oligonucleotides and antisense compounds have cytostatic, CC antistane oligonucleotides and antisense compounds have cytostatic, cophthalmological, immunomodulator, cardiant, neuroprotective, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound CC can be used for preparing a composition for treating a disease or CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                 Query Match

The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. antisense oligonucleotides and antisense compounds have cyrostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nostropic, antiarthritic, vasotropic, antiinflammatory, neuroprotective, nostropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
                                                                                                                                                                                                                                                                                                                                            The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9d34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.ginflammation, Alzheimer's disease, arthritis, diabetes, cancer or
ophthalmic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1 impGES-1 inhibitor; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiinflammatory; neuroprotective; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 4; SEQ

                                                                                                                                                                                                                                                                                                                   RESULT 1540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        expression of isoprenylcysteine carboxyl methyltransferase (also known as CICMT, PCCMT, pcMTase, PPMT, PPMTase, HSTE14, MST098 and MSTP098) and CIC located on chromosome 1p36. Specifically, it refers to compositions useful for inhibiting the expression of isoprenylcysteine carboxyl methyltransferase, which normally participates in cellular events such as growth factor signal transduction, cell replication, vesicular transport and the post-translational modification of the Ras family of GTPases. The present invention describes antisense oligonucleotides that comprise at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-methylcytosine. Accordingly, these compounds are useful for treating a disease or condition associated with isoprenylcysteine carboxyl methyltransferase such as a hyperproliferative disorder (e.g. cancer), an inflammatory condition, hypertension or cardiovascular disease. As such, they exhibit cytostatic, and are useful for research reagents and in diagnostics. This oligonucleotide sequence is a DNA oligo representing a preferred target site for antisense therapy in human isoprenylcysteine carboxyl methyltransferase, given in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                         The invention relates to a method of labelling a nucleic acid which involves incorporating at least one nucleotide analogue into a nucleic acid, where the analogue comprises an 8-S-substituted purine or 5-S-substituted pyrinidine analogue. The method is useful for labelling a nucleic acid. The method is useful for detecting a second nucleic acid of interest. The method is useful for labelling a nucleic acid which is used in hybridization assays, primer extension, terminal transferase additions, ligation, end labelling, PCR, nick translation labelling, reverse transcription, Southern blotting, Northern blotting, enzyme linked immunosorbant assays (BLISA), arrays, SKYE, cloning, transcription, abortive transcription, sequencing, diagnostic techniques, therapeutic applications, and treatment and prevention of diseases and conditions.
                                                                                                                Sequence 20 BP; 1 A; 6 C; 8 G; 5 T; 0 U; 0 Other;
                                                                                                                                                                    The labelled nucleic acids are useful in assessing methylation state of specific genes, detecting presence of known genetic mutations, detecting mRNA expression levels, detecting presence of pathogenic organisms, and detecting and amplifying proteins. The present sequence represents a

The method of the invention has cycostatic activity. The method is used to diagnose embryonal and/or alveolar rhabdomyosarcoma. Also conjugates of antibodies (directed against the extracellular domain of R-cadherin or against membrane proteins of skeletal muscle cells) with anticancer agents or R-cadherin-suppressing RNA are used for treatment or prevention of embryonal and/or alveolar rhabdomyosarcoma. Labelled antibody conjugates directed against the extracellular domain of R-cadherin can also be used for in vivo detection of R-cadherin-expressing tumour foci. R-cadherin is the first specific marker for rhabdomyosarcoma identified and allows differentiation between rhabdomyosarcoma and other diseases such as osteosarcoma and Ewing tumour. The present sequence represents a RT-PCR primer used in the invention to amplify R-cadherin.

                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                         CC expression of isoprenylcysteine carboxyl methyltransferase (also known as CIOMT, PCMMT, pcMMTase, PPMT, PPMTase, HSTE14, MST098 and MSTP098) and CC located on chromosome 1936. Specifically, it refers to compositions CC useful for inhibiting the expression of isoprenylcysteine carboxyl CC methyltransferase, which normally participates in cellular events such as CC growth factor signal transduction, cell replication, vesicular transport and the post-translational modification of the Ras family of GTPases. The CC least one modified sugar molety, a 2'-O-methoxyethyl (2' MOE) and at CC least one modified nucleobase, a 5-methylcytosine. Accordingly, these CC compounds are useful for treating a disease or condition associated with C1 (soprenylcysteine carboxyl methyltransferase such as a hyperproliferative CC isoprenylcysteine carboxyl methyltransferase such as hyperproliferative CC cardiovascular disease. As such, they exhibit cytostatic, and are useful for creatinflammatory, hypotensive and cardiant activities and are useful for creation reagents and in diagnostics. This oligonucleotide sequence is a phosphorothioate antisense DNA oligo used to modulate human CC exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                            Matches

The test sample, optionally treated, comprises a cell, collection of cells or tissue, and (I) expression is detected by measuring mRNA-specific probe, or (I) protein, using specific (RT)-PCR or with an mRNA-specific probe, or (I) protein, using specific antibodies, e.g. by Western blotting Primers for RT-PCR of (I) mRNA are ADL97944 and ADL97946 (sense); and ADL97945 (antisense). Note: The present sequence is the SEQ ID 1 as shown in the Sequence Listing. This sequence differs from the SEQ ID 1 shown in the disclosure (see

                                                                                                                           prepared from a plant homozygously having a mutation to be an object of the mapping; (b) A forward primer 1 containing a base corresponding to the gene polymorphic maker of one ecotype plant, a forward primer 2 containing a base corresponding to the gene polymorphic maker of one ecotype plant, a forward primer 2 containing a base corresponding to the genetic polymorphism of the other ecotype plant and a reverse primer 3 based on the base sequence common with both the ecotype plants are prepared; (c) two kinds of oligonucleotides emitting fluorescence of different colors when the genetic polymorphism marker is detected are prepared; (d) an amplification reaction of the genomic DNA is carried out in the presence of the primers 1, 2 and 3 and the two kinds of the presence
                                  of the primers 1, 2 and 3 and the two kinds of the oligonucleotides; (e) the fluorescence intensity emitted from the resultant reactional product is detected and (f) the position on the genome of the mutation site is determined from the results of detection. The present sequence is a primer, used to illustrate the invention

compound and composition are useful for treating a disease or associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower diabetic neuropathy, trigeminal neuropathy, arthritic pain, ac
                                                                                                                                                                            New antisense compound targeted to a nucleic acid molecule Navl.3, useful for useful for treating a disease or conditi with Navl.3, e.g. pain, seizure disorder such as childhood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            oligonuclectide compounds inhibit the expression of human Akt-1. Also disclosed is a method of inducing cytotoxicity in a cancer cell, comprising introducing into the cell an oligonuclectide that hybridises to a human Akt-1 sequence comprising RX-0194, TX-0201, RX-0616, RX-0627, RX-0628, RX-0632, or RX-0638. The new compounds may be used in pharmaceutical compositions to, e.g. prevent or delay infection, inflammation or tumour formation. These are useful for research and disgnostics. The backbone of each oligonuclectide was modified during synthesis to introduce phosphorothicate linkages between nucleotides, except at the 3' and 5' ends, to obtain an antisense oligonucleotide. The
                                                              The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3.
                                                                                                                             Claim 4; SEQ ID NO 1134; 417pp; English.

                                   rhabdomyosarcoma by in vitro detection, in a patient sample, of the expression of R-cadherin (I). The test sample, optionally treated, comprises a cell, collection of cells or tissue, and (I) expression is detected by measuring mRNA for (I), especially by reverse transcription (RT)-PCR or with an mRNA-specific probe or (I) protein, using specific antibodies, e.g. by Western blotting. Primers for RT-PCR of (I) mRNA are ADL97944 and ADL97946 (ensuse); and ADL97945 (antisense). Note: The present sequence is the SEQ ID I as shown in the disclosure. This sequence differs from the SEQ ID I shown in the Sequence Listing (see

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, includir but not limited to neonatal or infantile epilepsy; or ataxia. The press sequence represents a chimeric phosphorothioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target different regions of the human Navl.3 RNA.
                                                                                                                                                                      The present invention relates to a method for diagnosing embryonal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are
                                                                                                                                                                                                                                                                                                          Antilipaemic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                  (YOON/)

                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25510), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                    Homo sapiens
Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                          Synthetic.
                                                                                                                                                                                                                                                                                                                                                                    Antilipaemic; Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nuclecic acid target comprising gene(s) chosen from e.g. interleukin (IL) 4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is

The present invention relates to an oligonucleotide anti-sense to e.g., Committation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. comprising dene(s) chosen from e.g. compressing the compression of the configuration of the coligonucleotide and optionally surfactant operatively linked to the coligonucleotide. The method is useful for preventing or treating a consistency or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded consent for consent from airway inflammation, allergy(ies), asthma, impeded consentation, cystic fibrosis (F), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome construction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel single or multiple target oligonuclectide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e.g., CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory

The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (CDD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the

The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is
                                                                                                                                                                                                                                                                                                                                                                                                                     useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from alrway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant gene CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                airway inflammation; allergy; asthma; impeded respiration;

                                                                                                                                                                                                                                                                                                                               The present invention relates to a polynucleotide isolated from a gene and is useful for detecting a single nucleotide polymorphism human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                 Novel polynucleotide useful for PCR amplification along with two fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 JP2003259875-A

The present invention relates to a polynucleotide isolated from a gene and is useful for detecting a single nucleotide polymorphism human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotide useful for PCR amplification along with two fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.

               induces senescence in a mammalian cell. The method comprises assaying the expression of cellular genes in the cell in the presence and absence of the compound. The method is useful for identifying and modulating expression of tumour senescence genes. These may be used in treating diseases or conditions related to abnormal cell proliferation or neoplastic cell growth, in assessing the efficacy of the treatment of the disease or condition, or in identifying compounds that induce senescence in mammalian cells or that inhibit senescence-associated induction of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a compound comprising a sequence comprising 8-80 base pairs (bp) targeted to a nucleic acid encoding protein tyrosine phosphatase type IVA member 3 (PRL-3), that specifically hybridises with the nucleic acid encoding PRL-3 and inhibits expression of PRL-3, i.e. is an antisense oligonucleotide (AO). Also included are a composition comprising the compound and a carrier or diluent, inhibiting the expression of PRL-3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with PRL-3 and screening for an antisense compound. The antisense oligonucleotide is useful for preparing a composition for treating hyperproliferative disorder, particularly cancer (e.g. colorectal cancer), diabetes, reduced glucose tolerance, insulin resistance and obesity. The present sequence is an antisense oligonucleotide targeting hyman perca
cellular gene expression.
                                                                                                                                                                                                                                           Identifying compounds that induce senescence in mammalian cells, useful for treating e.g. cancer, comprises assaying the expression of cellular genes in the cell in the presence and absence of the compound.
                                                                                                                                                                                                                                                                                                                         WPI; 2004-091347/09.

                                                                                This invention relates to a novel DNA molecule which comprises a DNA molecule made up of the following elements in a 5' to 3' direction: a first restriction endonuclease site; a T3 promoter site; at least one Taggene comprising at least 5 20mer Tag sequences; a Poly A site having at least 1 consecutive A residues; a second restriction endonuclease site which may be the same or different than the first restriction endonuclease site; or T7 Promoter on the opposite strand as the T3 promoter. The invention may be useful in nucleic acid analysis, in particular to synthetic Tag genes useful as assay controls, in assay development, product development and validation and for quality control. The present sequence is that of a Tag oligonucleotide probe which may be used during the creation of the novel DNA molecule of the invention.
                                                                                                                                                                                                                                                                                                    New DNA molecules made by annealing and extending overlapping 60mer oligonucleotides, useful in producing synthetic Tag genes useful as controls, in assay development, product development and for quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           assay development; product development; product validation;
quality control; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               amplify genes that are up- or downregulated in doxorubicin-induced accelerated senescence to identify senescence-inducing compounds.

The compound specifically hybridises with the nucleic acid encoding Notchl and inhibits its expression. The compound has cytostatic and immunosuppressive properties and is suitable for used in gene therapy. The compound is useful for preparing a composition for treating a disease or condition associated with Notchl e.g., developmental, autoimmune or hyperproliferative disorders, such as cancer. This sequence represents an antisense oligonucleotide specific to human Notchl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense compound, having a sequence targeted to a nucleic acid encoding Notchl, useful for preparing a composition for treating a disease associated with Notchl e.g. autoimmune or hyperproliferative

The invention relates to

QJ

compound comprising a sequence comprising

New antisense oligonucleotide, comprising a sequence targeted nucleic acid encoding protein tyrosine phosphatase type IVA more treating hyperprojection for treating hyperprojection.

phatase type IVA member 3 (PI treating hyperproliferative

(PRL

Also included are a composition comprising the compound and a carrier or diluent, inhibiting the expression of PRL-3 in cells or tissues, treating an animal having or suspected of having a disease or condition associated with PRL-3 and screening for an antisense compound. The antisense oligonucleotide is useful for preparing a composition for treating hyperproliferative disorder, particularly cancer (e.g. colorectal cancer), diabetes, reduced glucose tolerance, insulin resistance and obesity. The present sequence is a Human PRL3 cDNA AO target region.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        lung cancer. The polynuclectides and polypeptides defined in the specification, antisense polynuclectides targeting the polynuclectides, antibodies targeting either one of the polynuclectides or polypeptides, and compounds identified by the screening methods are useful for preventing or treating malignant neoplasia. The disease treated is preferably breast cancer. The present sequence is that of a PCR primer which was used in the exemplification of the invention.
                              New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding PTP1B, useful for treating a disease/condition associated with PTP1B, such as cancer, diabetes or obesity.
                                                                                                                                                                                                                                                                                                                            18-JAN-2000; 2000US-00487368

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC This invention relates to novel compositions and methods for modulating CC the expression of PTP1B (also known as protein phosphatase 1B and PTPN1). CC Specifically, it refers to antisense compounds that can target and CC hybridise with a nucleic acid molecule encoding PTP1B, as well as splice CC phosphatase that plays an essential regulatory role in signalling CC mediated by the insulin receptor and as such is useful for treating CC diseases such as type 2 diabetes and obesity. Furthermore, PTP1B can can suspress transformation of oncogenic genes, such that compositions of this invention can also be used to treat hyperproliferative conditions CC including cancer. Accordingly, these compounds can be described as having CC cytostatic, antidiabetic and anorectic activities. This oligonucleotide CC sequence is an antisense DNA oligo that targets rat pTP1B DNA, and which CC has a phosphorothioate backbone and 2'-O-methoxyethyl wings, used in an CC exemplification of the invention.

The polypeptide is characterised by decreased specific binding CC to an antibody selected from GAD6, MICA-1, MICA-3, MICA-4 and MICA-6, CC where the decreased binding is relative to a corresponding GAD65 CC polypeptide not having the ES17P mutation. Also described: (1) methods CC encode the rat Ian5(1+) polypeptide; of or risk of type 1 diabetes in a subject; (2) an isolated mucleic acid selected from: (a) mucleic acids which encode the crat Ian5(1yp) polypeptide; or (c) full length complements of the nucleic acids of (a) or (b); (3) an antibody that: (a) specifically binds to rat Ian5(1yp) polypeptide; or (c) full length complements of the nucleic acids of (a) or (b); (3) an antibody is not immunologically cross-reactive with human Ian5 or mouse Ian5 polypeptide; or (b) specifically binds to rat Ian5(1yp) polypeptide, where the antibody is not immunologically cross-reactive with rat Ian5 polypeptide; or (b) specifically composers on construct comprising the following complements linked in operable combination: a transcriptional promoter, a complements linked in operable combination: a transcriptional promoter, a complements linked in operable combination: a transcriptional promoter, a compression construct described above; (6) a vector comprising the ecception of identifying agonists or antagonists of an Ian5 polypeptide; (c) an invitro method of identifying agonists or antagonists of an Ian5 polypeptide; (e) an invitro method of identifying agonists or antagonists of an Ian5 polypeptide; (e) anthod for identifying agent therapy for type 1 diabetes, and (11) a method for identifying a genetic mutation that correlates with type 1 (c) diabetes. GAD65 has antidabetic activity, and can be used in gene therapy for type 1 diabetes or a related disorder. The present constitution of the present invention are useful constituted activity and can be used in developing gene therapy for type 1 diabetes or a related disorder. The present pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 1513

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a compound targeted to a nucleic acid molecule encoding Notch1 and which inhibits the expression of Notch1. The compound, composition and methods are useful for treating a disease or condition associated with Notch1, such as an autoimmune disorder, aberrant apoptosis or a hyperproliferative disorder, e.g. cancer. They are also useful in research and diagnostics for modulating the expression of Notch1. The present sequence represents a human Notch1 antisense
is useful for prediction, diagnosis or prognosis of malignant neoplasia such as breast cancer, ovarian cancer, gastric cancer, colon cancer, oesophageal cancer, mesenchymal cancer, bladder cancer or non-small celi
                                                                                           This invention relates to a novel method for the prediction, diagnosis, or prognosis of malignant neoplasia by the detection of at least two markers. The invention may also be useful for the development of cytostatic compounds through the regulation of the expression of a gene cytostatic to the approximate through the regulation of the expression of a gene constituty of a protein associated with malignant neoplasia. The method
                                                                                                                                                                                                                                                                                                                                                        Predicting, diagnosing or prognosing malignant neoplasia by detecting least two markers, where the markers are genes from one or more chromosomal regions altered in malignant neoplasia,.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gastric cancer;

The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or burnfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emplysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc oligonucleotides are derived from a gene encoding or regulating compression of a target polypeptide associated with lung airway or lung comparison of cancer and can be anti-sense to the corresponding mRNA. Cc The invention also describes a kit, that comprises: (a) a delivery construction also describes a kit, that comprises: (b) a delivery construction also describes a kit, that comprises: (a) a delivery construction as antiallergic, antiinflammatory, antiasthmatic, analysis of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, antiagesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition and/or bronchoconstriction and/or lung confidency obstruction, and/or bronchoconstriction and/or lung confidency of the condition such as pulmonary vasoconstriction.

Cc inflammation, allergies, asthma, impeded respiration, respiratory confidency pain, cystic fibrosis, allergic rhinitis, pulmonary distances, pulmonary confidency pain, cystic fibrosis, allergic rhinitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system content any unwanted effects due to it.

Example 2; SEQ ID NO 32; 87pp; English

disorder in human subjects. New GAD65 polypeptide comprising the presence of or risk of developments

developing

an

ES17P mutation, useful ng type 1 diabetes or a

for detecting

```
CC oligonucleotides are derived from a gene encoding or regulating CR expression of a target polypeptide associated with lung airway or lung CR dysfunction or cancer and can be anti-sense to the corresponding mRNA. CR The invention also describes a kit, that comprises: (a) a delivery CR instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, CR analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenargic agonist. The composition is useful for preventing or CR treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The CR pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated CR with a disease or condition such as pulmonary vascoonstriction, confidency pain, cystic fibrossis, altergic ration, respiratory transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system cR., lung, brain, heart, kidney, etc, tissue environment and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 1509

         This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating CC comprising oligonucleotides, effective for alleviating CC comprising oligonucleotides, effective for alleviating composition, respiratory tract inflammation, allergies and CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, composition of hyposecretion, when administered to a mammal. The CC oligonucleotides are derived from a gene encoding or regulating CC expression of a target polypeptide associated with lung airway or lung CC dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, CC treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                문

                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                       5
                                                                                                                                                                                                                                                                                                                                                                                                             CC The invention also describes a kit, that compositions (a) adelivery constructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a currier and for use of the kit. The composition composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, allergies and/or burdaction and/or lung conflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, conflammation, allergies, asthma, impeded respiration, respiratory conflammation, allergies, asthma, impeded respiration, respiratory conflammation, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system c.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and pronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptor surfactant depletion or hyposecretion, when administered to a mammal. I oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and
Human; antisense; bronchoconstriction; allergy; hyposecretion; pain;
                                   AI654215-derived oligonucleotide SEQ ID 4894.

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

SEQ ID NO 4894; 763pp; English.

CC dysfunction of cancer and can be anti-sense to the corresponding mRNA.

CC The invention also describes a kit, that comprises: (a) a delivery

CC device, in separate containers, (b) the oligonucleotides, (c)

CC instructions for adding a carrier and for use of the kit. The composition

CC of the invention has antiallergic, antiinflammatory, antiasthmatic,

CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a

CC treating a respiratory, lung or malignant disease. The administered

CC composition comprises oligo and is administered to reduce the production

CC or availability, or to increase the degradation of the target mRNA or to

CC reduce the amount of target polypeptide present in the lungs. The

CC inflammation, allergies and/or surfactant hypoproduction are associated

CC with a disease or condition such as pulmonary vasoconstriction,

CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary

CC thymidines present in the target RNA serves to prevent the breakdown of

CC thymidines present in the target RNA serves to prevent the breakdown of

CC thymidines present in the target RNA serves to prevent the breakdown of

CC e.g., lung, brain, heart, kidney, etc, it issue environment and thereby, to bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) recepts surfactant depletion or hyposecretion, when administered to a mammal oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or number processing of the polypeptide associated with lung airway or number process. This invention describes a novel composition (a) a fir comprising oligonuclectides, effective for alleviating any unwanted effects due ő (a) a first active agent, (A) receptors, or lung

The CC oligonucleotides are derived from a gene encoding or regulating CC expression of a target polypeptide associated with lung airway or lung CC dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a Deta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered CC composition comprises oligo and is administered to reduce the production of the target mRNA or to contain a contain and/or bronchoconstriction and/or lung cor availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The CC pulmonary obstruction, and/or bronchoconstriction and/or lung corrected to reduce the production, and/or bronchoconstriction and/or lung corrected corrected to reduce the production, allergies and/or bronchoconstriction and/or lung corrected corrected to reduce the production, allergies, asthma, impeded respiration, respiratory confilmmation, allergies, asthma, impeded respiration, respiratory hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. CC thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into product. It saue environment and thereby, to the oligonucleotides into product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

CC expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a ctreating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The compliant adisease or condition, and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, are associated conflammation, allergies and/or surfactant hypoproduction are associated distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system c.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptor surfactant depletion or hyposecretion, when administered to a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 15; SEQ ID NO 13890; 763pp; English

                                                                                                                                    This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiastimatic, in
analgesic, hypotensive, immunosuppressive and cytostatic activity, beta adrenargic agonist. The composition is useful for preventing ctreating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the produced to the composition comprises oligo and is administered to reduce the produced to the composition comprises of the composition composition comprises of the composition co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted nucleic acids associated with lung airway or lung dysfunction, and

                                                                                                                                                                                                                                                                                                                                                  reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

bronchodilating agent. nucleic oligonucleotide eutical composition for treating asthma, has antisense cleotide containing less percentage of adenosine, targueries acids associated with lung airway or lung dysfunction composition e containing e of adenosine, targe or lung dysfunction, adenosine, targeted ç

Claim 15; SEQ ID NO 4183; 763pp; English.

CC expression of a target polypeptide associated with lung airway or lung conversion or cancer and can be anti-gense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or CC treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to CC reduce the amount of target polypeptide present in the lungs. The CC pulmonary obstruction, and/or bronchoconstriction and/or lung confidency of inflammation, allergies and/or surfactant hypoproduction are associated confidency allergies, asthma, impeded respiration, respiratory confidency confidency, allergies, asthma, impeded respiration, respiratory confidency, allergies, asthma, impeded respiration, respiratory confidency pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonacteotides into products that free adenosine into the system content of the anti-sense alengane tand thereby, to prevent any unwanted effects due to it comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflamation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) recept surfactant depletion or hyposecretion, when administered to a mammal oligonucleotides are derived from a gene encoding or regulating describes novel composition (a) a first active receptors, mammal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targe nucleic acids associated with lung airway or lung dysfunction,

CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC unflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction.
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC inflammation, allergies, asthma, impeded respiration, respiratory
                                                                                                                      Matches
                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                               with a disease or condition such the products that free adenosine inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the rarget RNA serves to prevent the system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel composition

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of calculating a rate factor, which is proportional to initial rate, for hybridisation to an RNA molecule by a given antisense nucleic acid. The method involves calculating the meltin energy required to convert specific regions of the RNA molecule to a single-stranded state; the energy gain resulting from hybridisation of the specific regions of the RNA molecule to an oligonuclectide; and the rate factor. The method is useful for calculating a rate factor that is proportional to a rate constant for hybridisation between complementary nucleic acids. The method is particularly useful for estimating initial rates, predicting nucleation sites and selecting target sites for antisense attack of RNA. The invention is useful in antisense generated the search of the property of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Calculating a rate factor that is proportional to initial rate, for predicting nucleation sites and selecting target sites for antisense attack of RNA, comprises calculating the melting energy and energy gain of regions of the RNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         expression. TRIP6 is also known as OPA-interacting protein-1 (OIP-1) and zyxin-related protein-1 (ZRP-1). TRIP6 DNA is located on chromosome 7q22. Antisense compounds of the invention are useful for modulating the expression of TRIP6 and for treating diseases or conditions associated with the expression of TRIP6 such as hyperpoliferative disorders (e.g. cancer). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. The are also useful in antisense therapy. The present sequence is an antisense oligo targetted to human TRIP6 DNA. This oligo is used in the exemplification of the invention

The DNA and protein sequences of the invention are useful in the diagnosis and treatment of thrombocytopenic purpura, and in developing drugs for myocardial infarction, cerebral infarction, arteriosclerosis, platelet thrombosis, and tenosis. The present DNA sequence represents a human von Willebrand factor (vWF) closure and sequence represents a human von Willebrand factor (vWF) closure and sequence represents a human von Willebrand factor (vWF) closure and sequence represents a human von Willebrand factor (vWF) closure and sequence represents a human von Willebrand factor (vWF) closure and sequence represents a human von Willebrand factor (vWF) closure and sequence represents a human von Willebrand factor (vWF) closure and sequence represents a human von Willebrand factor (vWF) closure and vWF) closure 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          von Willebrand factor-cleaving enzyme, applicable in diagnosis of, and supplementary therapy for, thrombotic thrombocytopenic purpura, and for developing drugs for e.g. myocardial infarction and cerebral infarction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence

The DNA and protein sequence in the invention are useful in the diagnosis and treatment of thrombocytopenic purpura, and in developing drugs for myocardial infarction, cerebral infarction, arteriosclerosis, platelet thromand stenosis. The present DNA sequence represents a human von Willer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           von Willebrand factor-cleaving enzyme, applicable in diagnosis of, and supplementary therapy for, thrombotic thrombocytopenic purpura, and for developing drugs for e.g. myocardial infarction and cerebral infarction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           useful in any bioluminescent assay which utilises luciferase/luciferin reaction as signaling mode. The present sequence is probably a mutagenic PCR primer used to construct a DNA encoding a mutant luciferase from Photinus pyralis, however it is displayed in figure 8, a figure not referred to anywhere in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            lampyris noctiluca, Pyrocoelia nayako or Photinus pennsylanvanica, where in the luciferase, an amino acid is different from a corresponding residue in wild-type and has increased thermostablity. Also included are a nucleic acid which encodes the thermostable luciferase, a vector comprising the nucleic acid, a cell transformed with the vector, a plant comprising the cell, producing the thermostable luciferase and a kit comprising the thermostable luciferase. The thermostable luciferase is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New luciferase enzyme having increased thermostability and which is a mutant form of the wild-type enzyme, useful for bioluminescent assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Murray JAH,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       23-JAN-2004; 2004AU-00200277

SXCCCCCCCCCCCX PX PTX XX.
                                      The invention relates to a luciferase (thermostable mutant) having 60% cc similarity to luciferase of Photinus pyralis, Luciola mingrelica, cc L.cruciata, L.lateralis, Hotaria paroula, Pyrophorus plagiophthalamus, cc Lampyris noctiluca, Pyrocoelia nayako or Photinus pennsylanvanica, where in the luciferase, an amino acid is different from a corresponding cresidue in wild-type and has increased thermostability. Also included are nucleic acid which encodes the thermostable luciferase, a vector comprising the nucleic acid, a cell transformed with the vector, a plant comprising the cell, producing the thermostable luciferase and a kit comprising the thermostable luciferase is cuseful in any bioluminescent assay which utilises luciferase/luciferain creaction as signaling mode. The present sequence is probably a mutagenic CC R primer used to construct a DNA encoding a mutant luciferase from CC PK primer used to construct a DNA encoding a mutant luciferase from CC PK primer used to construct a DNA encoding a mutant luciferase from CC photinus pyralis, however it is displayed in figure 8, a figure not crearing the comprise of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New luciferase enzyme having increased thermostability and which mutant form of the wild-type enzyme, useful for bioluminescent as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Fig 8; 40pp; English.

                                                                                                                                                                                                                                 The invention relates to a luciferase (thermostable mutant) having 60% similarity to luciferase of Photinus pyralia, Luciola mingrelica, L.cruciata, L.lateralis, Hotaria paroula, Pyrophorus plagiophthalamus, Lampyris noctiluca, Pyrocoelia nayako or Photinus pennsylanvanica, where in the luciferase, an amino acid is different from a corresponding residue in wild-type and has increased thermostability. Also included are a nucleic acid which encodes the thermostable luciferase, a vector comprising the nucleic acid, a cell transformed with the vector, a plant comprising the cell, producing the thermostable luciferase and a kit comprising the thermostable luciferase. The thermostable luciferase is useful in any bioluminescent assay which utilises luciferase (luciferin reaction as signaling mode. The present sequence is a mutagenic PCR primer used to construct a DNA encoding a mutant luciferase from Photinus
